

## Single Number

Given a non-empty array of integers  $nums$ , every element appears twice except for one. Find that single element.

Yoo

Ex:

Input:  $nums = [2, 2, 1]$

output: 1

Input:  $nums = [4, 1, 2, 1, 2]$

output: 4

constraints:

- $1 \leq nums.length \leq 3 \times 10^4$
- $-3 \times 10^4 \leq num[i] \leq 3 \times 10^4$
- Each element in array appears twice except for one which appears once.

## Algorithm

- 1) Initialize  $result = 0$
- 2) Iterate through each element in array and perform XOR with result.
  - Numbers that appear twice cancel out ( $x \oplus x = 0$ )
  - Numbers that appear once remains in result
- 3) Return result

How it works:

$$\text{nums} = [4, 1, 2, 1, 2]$$

$$\text{result} = 4^1 \wedge 2^1 \wedge 2$$

$$= 4^1 (1^1)^1 (2^2)$$

$$= 4^0 \wedge 0$$

$$= 4.$$

Dry run:

$$\text{nums} = [4, 1, 1, 2]$$

$$i = 0$$

$$\Rightarrow \text{result} = 0$$

$$\Rightarrow \text{result} = \text{result} \wedge \text{nums}[i]$$

$$\text{result} = 0^4$$

$$\text{result} = 4$$

$$i++ \Rightarrow i = 1$$

$$\text{result} = 4$$

$$\Rightarrow \text{result} = 4^1$$

$$\text{result} = 5$$

$$i++ \Rightarrow i = 2$$

$$\text{result} = 5^2$$

$$\text{result} = 4 \Rightarrow \text{return } 4$$

code:

```
class Solution {
```

```
    public int singleNumber(int[] nums) {
```

```
        int result = 0; // stores element to return
```

```
        for (int i = 0; i < nums.length; i++) {
```

```
            // iterates through array elements
```

```
            result ^= nums[i]; // cancels out pairs
```

```
        }
```

```
        return result;
```

```
    }
```

Time complexity:  $O(n)$

Space complexity:  $O(1)$
